

Tommi Haapa

Software Engineer

Sipoo, Finland | tommi.eemeli.haapa@gmail.com

Full-stack software engineer with 5+ years of experience spanning fintech SaaS platforms to embedded Linux applications. I don't stick to old habits — I actively build agentic workflows into my day-to-day development using Claude Code, Cursor, and GitHub Copilot, applying spec-driven development so agents can run tests, refactor, and handle repetitive tasks against a clear spec, freeing my time for architecture and problem-solving. MCP and Figma integrations have also significantly sped up my design-to-code workflow.

Fluent in English and Finnish.

SKILLS

Languages & Frameworks: TypeScript, JavaScript, React, Node.js, C#, .NET, Qt/QML, Kotlin, HTML, CSS

Cloud & DevOps: Azure, Azure DevOps, Docker, CI/CD, Ansible, CMake, PowerShell, Bash

Databases: SQL, PostgreSQL

Testing: xUnit, Moq, FluentAssertions, Jest, Cypress

AI-Assisted & Agentic Development: Claude Code, GitHub Copilot, Cursor, MCP, spec-driven development, agentic workflows, agent loops

Other: Linux, SSH, Figma (MCP)

EXPERIENCE

Software Engineer, Reaktor

2025 - 2026

Designing and delivering modern software solutions as a consultant, working closely with sales teams and customers from early concept and pre-sales phases to technical definition and implementation.

- Designing and developing a cross-platform Qt/QML application for Linux-based environments
- Building and maintaining deployment and provisioning workflows for Linux devices using automation tools
- Collaborating with stakeholders to ensure high-quality, modern, and maintainable software solutions
- Demonstrating and presenting software solutions in customer-facing contexts

Selected project experience:

- Delivered a modern In-Flight Entertainment (IFE) demo application for RAVE Aerospace, showcasing hardware capabilities through a polished and user-friendly interface
- Developed the application using Qt/QML with a focus on clean architecture and visual quality
- Implemented build and configuration workflows using CMake and automation with Ansible
- Worked extensively in Linux environments, utilizing tools such as SSH for device management, deployment, and debugging
- Contributed to preparing and showcasing the solution at the Aircraft Interiors Expo (AIX) in Hamburg (2026)

Contributed to the sales process as a technical specialist, helping define the technical architecture for a modernized web presence and a new investment platform for EQ.

Technologies: Qt, QML, Kotlin, CMake, Ansible, Linux, Bash, SSH, embedded Linux tooling, and modern software design practices.

Software Engineer, Evitec Solutions Oy

2021 - 2025

Designing and developing a modern SaaS lending platform for the financial sector, supporting the full lifecycle of corporate lending — from origination and decision-making to servicing and ongoing management. The solution is built to be scalable, highly automated, and securely integrated into financial institutions' ecosystems.

Worked with key clients including Valtiokonttori and Kuntarahoitus, delivering tailored solutions to meet complex regulatory and business requirements.

In addition to hands-on development, acted as a mentor for three junior developers, supporting their technical growth, onboarding, and day-to-day problem solving.

Responsibilities included:

- Specifying and designing new features in close collaboration with customers, fellow developers and product owner
- Developing both frontend and backend functionality across our product stack
- Building and maintaining CI/CD pipelines and infrastructure in Azure
- Implementing database solutions and optimizations with a focus on performance and scalability
- Writing and maintaining automated tests across unit, integration, and end-to-end levels
- Continuously improving tooling, automation, and our overall development workflows

Tech stack: HTML, CSS, TypeScript, JavaScript, NodeJS, React, C#, .NET, PowerShell, SQL, YAML, Azure DevOps, Azure cloud services, Docker, xUnit, Moq, FluentAssertions, Jest, and Cypress.

PERSONAL PROJECTS

Developing and maintaining independent full-stack applications using a consistent technology stack of React, Node.js, and PostgreSQL.

Built and launched autojentuontiverot.fi, a public web service designed to simplify and streamline car import tax calculations for users in Finland.

All personal projects are developed end-to-end, covering architecture design, implementation, deployment, and ongoing maintenance. Additional projects and code samples are available on [GitHub](#).

EDUCATION

IT - Tradenomi, Laurea

January 2019 - June 2022
